

# Vaccinations and COVID-19

COVID-19 is so new and different that it requires its own vaccine and researchers are currently trying to develop one, however this can take up to 18 months

Vaccines against Pneumonia such as Pneumococcal vaccine, Whooping Cough and Influenza do not provide protection against COVID-19, however vaccination against respiratory illness is highly recommended to protect your health

We strongly suggest having your flu shot as early as possible in 2020
